Field of view _____ Power 73x

← COPY SHOWS "NUCLEUS" - THERE WAS NONE - BY 1/12/04

- Can this cluster be seen with direct vision, or is averted vision required? Wind "brings it out"
- Is the core unusually bright, compact or not distinguishable? Just an unresolved glow
- Is this globular cluster highly or loosely concentrated? presumed
- Is any part of the cluster resolved into stars? No
- Is any mottling visible? Barely
- Can the edges be resolved? No
- Are there any other deep-sky objects in the same field of view? If so, what? No

Description Seen but cannot resolve - it is noticeably
"globular" in glow - not a galaxy
interesting little gray to SE as shown

Field of view _____ Power 47

- Can this galaxy be seen with direct vision, or is averted vision required?
- What is the overall shape? sl. elongated
- Is a core noticeable? No
- Is the core compact or stellar? N/A
- Can any detail be seen between the core and the outer envelope of the object? No
- Are the edges of the outer envelope sharp or diffuse?
- Can any detail or mottling be seen in the outer envelope (bright or dark patches or lanes)? No
- Are there any other deep-sky objects in the same field of view? If so, what? No

Description NOTE: 73x brought out stellar nucleus, which seems a little off-center, and a small amount of mottling, a few more faints nearby.

w/ neb filter (wide band)

Can both the cluster and nebula be seen with direct vision, or is averted vision required?

Is there an overall shape of the object or is it simply irregular? Cluster - nothing strange

Is any part of the outer edge of the nebula sharply defined? Nebula - 3 major pieces

Are the stars more concentrated in any one particular area? How many stars are in the cluster? add up to almost

Is the cluster embedded in the nebulosity or is there a distinct separation? No, ~20

Is any part of the nebula brighter or more concentrated? Southern part - maybe

Is there any particular area where you notice an absence of stars in this cluster? and western small patch

Are there any voids or dark patches, or lanes in the nebula? Any bright filaments or streamers? Outside of cluster

Any suggestions for observing this nebula (L.e. filter, power, field of view, etc.)? to NW is dark area - very few stars

Are there any other deep-sky objects in the same field of view? If so, what? "Flower petal" effect - but dark area makes it

Description Draw this day w/ no neb filter - added it

Size 125

Eyepiece 40

Field of view _____ Power 47X

- Can this galaxy be seen with direct vision, or is averted vision required?
- What is the overall shape? Sploches (@ 9:15 pm - could almost complete round "face")
- Is a core noticeable? yes
- Is the core compact or stellar?
- Can any detail be seen between the core and the outer envelope of the object? Splochy pattern of glow
- Are the edges of the outer envelope sharp or very diffuse?
- Can any detail or mottling be seen in the outer envelope (bright or dark patches or lanes)?
- Are there any other deep-sky objects in the same field of view? If so, what? N6

Description Revisited @ 9:15 pm CST when higher - brighter
showed against fainter sky with better, no more
detail, just easier to enjoy.

Field of view _____ Power 47

- Can both the cluster and nebula be seen with direct vision, or is averted vision required? *does add some more unres'd glow*
- Is there an overall shape of the object or is it simply irregular? *Round w/ line of faints off to NE*
- Is any part of the outer edge of the ^{cluster} nebula sharply defined? *Fairly well*
- Are the stars more concentrated in any one particular area? How many stars are in the cluster? *No - hundreds w/ unres'd glow*
- Is the cluster embedded in the ~~nebula~~ ^{cluster} or is there a distinct separation?
- Is any part of the ~~nebula~~ ^{cluster} brighter or more concentrated? *No - very even*
- Is there any particular area where you notice an absence of stars in this cluster? *No*
- Are there any voids or dark patches, or lanes in the ~~nebula~~ ^{cluster}? Any bright filaments or streamers? *line of faints is even in front of main cluster*
- Any suggestions for observing this nebula (I.e. filter, power, field of view, etc.)? *low power*
- Are there any other deep-sky objects in the same field of view? If so, what? *No*

Field of view _____ Power 47

- Can this galaxy be seen with direct vision, or is averted vision ^{to lengthen} required?
- What is the overall shape? very elongated
- Is a core noticeable? Yes
- Is the core not very compact or stellar?
- Can any detail be seen between the core and the outer envelope of the object? No
- Are the edges of the outer envelope sharp or diffuse?
- Can any detail or mottling be seen in the outer envelope (bright or dark patches or lanes)? No
- Are there any other deep-sky objects in the same field of view? If so, what? No

Description Still a little low - but very easily seen very
elongated - fun to trace out as far as you can

Went back @ 7:45 pm - yes, west side is "cut off"

Revisited @ 9:10 pm when higher - same view!

Field of view _____ Power 153

• Can this cluster be seen with easy direct vision, or is averted vision required?

• Is the core unusually bright, compact or not distinguishable?

• Is this globular cluster highly or loosely concentrated?

• Is any part of the cluster resolved into stars? yes - edges

• Is any mottling visible? yes - 1/2 in to core

• Can the edges be resolved? Barely yes

• Are there any other deep-sky objects in the same field of view? If so, what? No
